

Let sound become a useful visual cue.

A proposed sidecar that preserves timing and uncertainty
before a reviewed pictogram reaches the viewer.

MOVIES • CONCERTS • FESTIVALS • SPORTS • HOME & COMMUNITY

A sound can matter before a viewer knows what it was.

Media and real-world listening can contain fast, overlapping or off-screen events. A visual cue may help a person notice, identify or locate the moment.

MOVIE

**A door closes
off screen**

Sound + timing + context

CONCERT

**A crowd swells
before the chorus**

Sound + timing + context

SPORTS

**A whistle changes
the action**

Sound + timing + context

HOME

**A timer, knock or
alarm competes for
attention**

Sound + timing + context

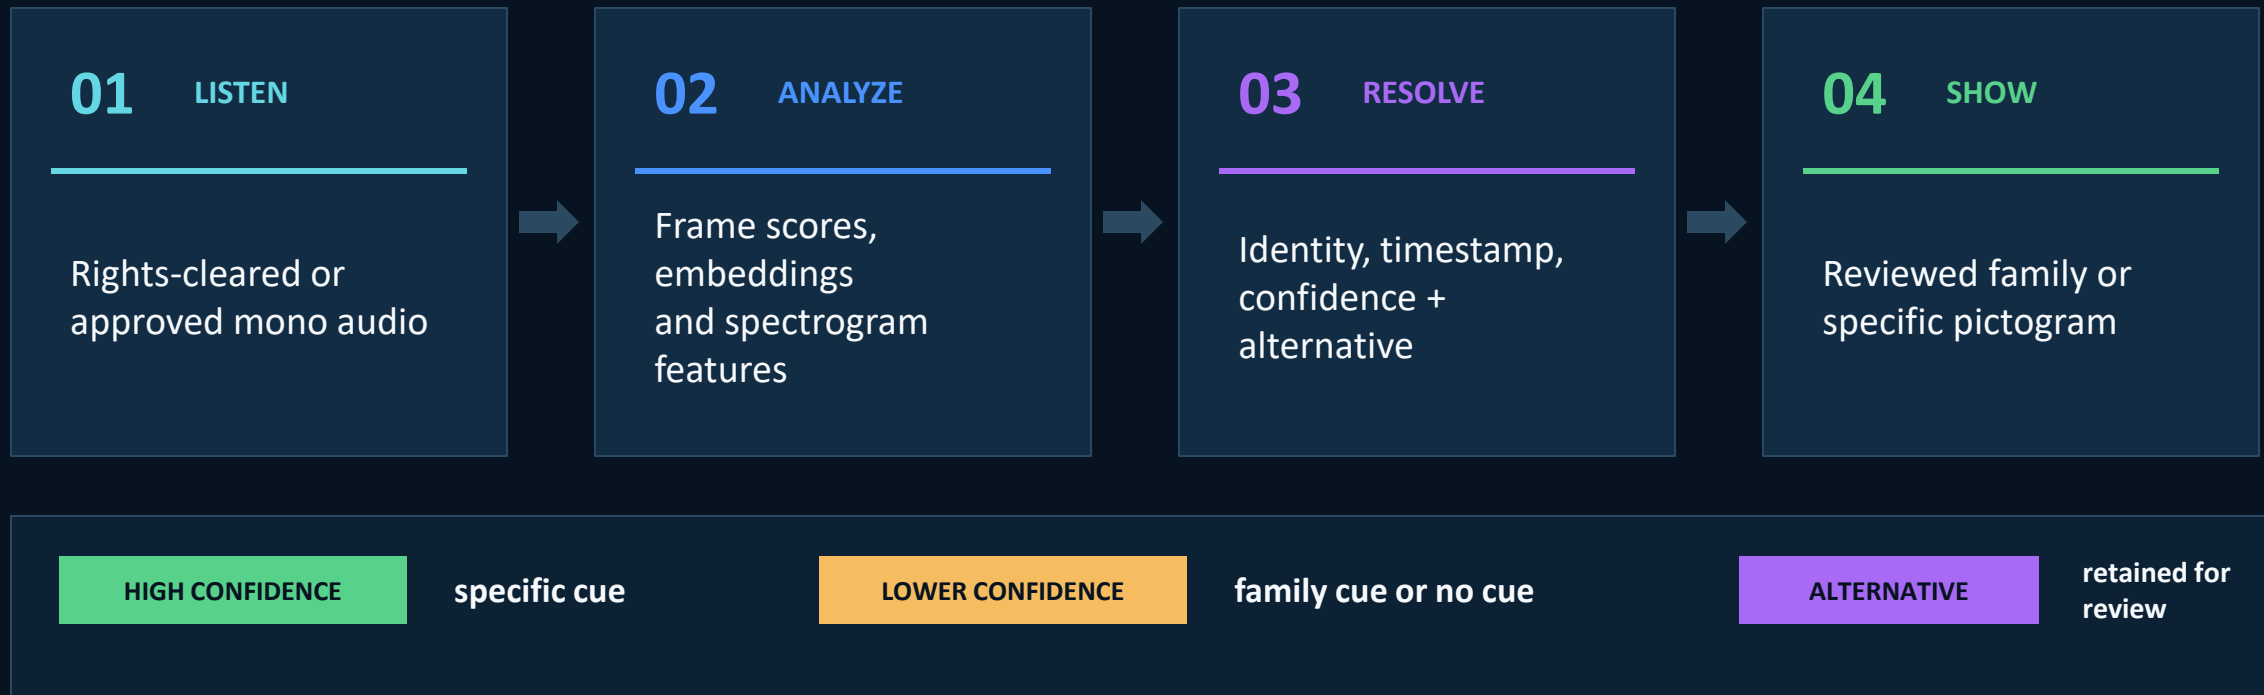

Design target

Add a useful visual signal without pretending the system knows more than the evidence supports.

Preserve uncertainty before you show the symbol.

SEOS is designed to carry timing, identity and confidence through a review-controlled path.

Separate the working baseline from the release gates.

This is the current SEOS evidence boundary as of September 30, 2026.

WORKING BASELINE

Live pictogram review library

687 sound concepts • 12 audience/style packs
8,214 generated pack images

Structured human review is active

146 verdicts recorded at audit • pack gaps remain

RELEASE GATES

12 packs require semantic and rights review

681–687 images per pack; gaps remain

? production approval manifest

? live Sense Director integration

? accuracy and latency claims

Human review before viewer release

Candidate cue studies must survive comprehension, confusion and control checks before the viewer sees them.

UNDERSTAND

Does the cue communicate the intended sound?

DISTINGUISH

Can reviewers tell likely confusion pairs apart?

CONTROL

Can a viewer reduce, mute or opt out?

One sound. Twelve visual approaches.

Thunder shown across the active audience and style packs.
